Desktop Spaces • Macros to Improve Navigation and Window Management, v3.0

WhichSpace provides two functions:

1. Displays the Desktop Space number in the macOS menu bar. This is a nice feature, but technically not required to use this macro group.

2. Provides the capability to retrieve the current Desktop Space number via AppleScript. This is required to use this macro group and done in macro **sub—Get DesktopNo**.

Installation

Double-click **WhichSpace – Download Latest Release.webloc** to install this free, open-source application.

Alternate Installation

If you prefer to install **WhichSpace** using HomeBrew, open Terminal and run the following command:

```
brew install --cask whichspace
```

Open WhichSpace During Each Login

Regardless of the installation method, set **WhichSpace** to open (start) during each login.

Desktop Space Number Appearance With macOS Sonoma

With **WhichSpace 0.3.2**, the menu bar icon is slightly misaligned under macOS Sonoma. This cosmetic issue does not effect the function of this macro group.
